To optimize the processing of natural gas, accurate thermodynamic data are required. Here, we investigate the quality of the physically based BACKONE equation of state, which requires only 3 – 5 substance specific parameters for each pure component. For mixtures, only one mixture parameter for each binary and no ternary parameters are required.

However, highly accurate data for thermodynamic properties at liquid states of the relevant systems are rare. While most properties can be determined at liquid states with higher accuracy than at gaseous or supercritical states for pure fluids, it is difficult to determine the exact composition of the liquid in the measuring cell for the mixtures considered here.

While this can be a valid assumption for mixtures of fully miscible and similarly sized molecules, it may not hold accurate when studying, e.g., thermodynamic properties of large solvated molecules such as typical outer-sphere electrochemically active complexes, liquid mixtures where the difference in size of the various molecules is pronounced, and fully immiscible or partially immiscible liquids.

Thermodynamic properties and relations In order to carry through a program of finding the changes in the various thermodynamic functions that accompany reactions—such as entropy, enthalpy, and free energy—it is often useful to know these quantities separately for each of the materials entering into the reaction.

Thermodynamic properties.

Thermodynamic properties are the characteristics (identifiable and observable) of a system by which it can be specified. For example: mass, volume, temperature, pressure etc. Thermodynamic properties can be divided into two groups. Extensive properties. Intensive properties.
