The third and fourth instructions say that, at any moment the automaton may move from state p to state q . The fifth instruction says that in state q , for each symbol 1 read, one A is popped. Finally, the sixth instruction says that the machine may move from state q to accepting state r only when the stack consists of a single Z .

A Turing machine is a mathematical model of computation that defines an abstract machine, which manipulates symbols on a strip of tape according to a table of rules. Despite the model's simplicity, given any computer algorithm, a Turing machine capable of simulating that algorithm's logic can be constructed.. The machine operates on an infinite memory tape divided into discrete

In doing so, the authors show that we do not need computers to compute and we do not need computation to infer. It invites readers to rethink the computer and computing, and appeals to computer scientists, mathematicians, physicists and philosophers.
