Genetics is the study of how genes bring about characteristics, or traits, in living things and how those characteristics are inherited. Genes are specific sequences of nucleotides that code for particular proteins. Through the processes of meiosis and sexual reproduction, genes are transmitted from one generation to the next.

Mendelian Genetics. The breeding experiments of the monk Gregor Mendel in the mid?1800s laid the groundwork for the science of genetics. He published only two papers in his lifetime and died unheralded in 1884. The significance of his paper published in 1866 on inheritance in peas (which he grew in the monastery garden) apparently went unnoticed for the next 34 years until three separate botanists, who also were theorizing about heredity in plants, independently cited the work in 1900.

Gregor Mendel (1822–1884), an Austro-Hungarian monk, discovered what is considered to be the very foundation of genetics by growing pea plants in the garden of his monastery. He didn't have lab or sophisticated equipment, no exotic islands with unusual species to inspire him, just some dirt, some pea plants, and of course, lots of curiosity.
