If $f(x)$ is a function defined on an interval $[a,b]$, the definite integral of f from a to b is given by. (Chapter 5.1) $\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i) \Delta x$, provided the limit exists. If this limit exists, the function $f(x)$ is said to be integrable on $[a,b]$, or is an integrable function. The numbers a and b are called the limits of integration;

Bookmark File PDF Chapter 5 Integration And Its

specifically, a is the lower limit and b is the upper limit.

on a closed interval $[a, b]$, the (def- inite) integral $\int_a^b f(x) dx$ of f over $[a, b]$ is the area of the (x, y) plane bounded by the graph of f , the x axis and the vertical lines $x = a$, $x = b$, where areas above and below the x axis count as being positive and negative respectively.

At its heart, (using the notation of Theorem 5.5.1) substitution converts integrals of the form $\int_a^b f(g(x))g'(x) dx$ into an integral of the form $\int_c^d f(u) du$ with the substitution of $u = g(x)$. The following theorem states how the bounds of a definite integral can be changed as the substitution is performed.

The calculation of the call price in the Heston model often requires the evaluation of an integral. This is true for most of the formulations of the call price we have encountered, that by Heston (1993), Lewis (2000, 2001), Carr and Madan (1999), or Attari (2004).

The chapter shows how the equations may be converted to a weak form using a simple direct approach in which each differential equation is multiplied by an arbitrary function and integrated over its domain. Using integration by parts allows direct introduction of the some boundary condition.
