Energy Source or Illumination (A) - the first requirement for remote sensing is to have an energy source which illuminates or provides electromagnetic energy to the target of interest. 2. Radiation and the Atmosphere (B) - as the energy travels from its source to the target, it will come in contact with and interact with the atmosphere it passes through.

Fundamentals of Remote Sensing - Introduction

Remote sensing or Earth Observation is defined as the art, science and technology through which the characteristics of object features/targets either on, above or even below the Earth's surface are identified, measured and analyzed without direct contact existing between the sensors and the targets or events being observed, see e.g., [1, 2, 3 ...

As we know all about remote sensing, let's discuss its fundamentals. A remote sensing system works with the help of a detector for sensing the reflected or emitted energy from the surface of the Earth. It may be modified by the interposing atmosphere. The sensor is available on a drone, satellite, or aircraft.
