The Compound Effect is a motivational book about what he calls - wait for it - the Compound Effect. The concept is basically to say that smaller steps over a long period of time will have a greater, more beneficial and successful effect on your life than bigger steps in a shorter period of time (that most people will not stick to).

~~About the Author - Sarah Namulondo~~

The Compound Effect is the principle of reaping huge rewards from a series of small, smart choices. Darren Hardy’s formula is: “Small, smart choices + consistency + time = Radical Difference.”. To hit a home run on this concept, I want to give you one of my favorite examples from the book:

The compound effect is the strategy of reaping huge rewards from small, seemingly insignificant actions. Small choices + consistency + time = significant results. Tony Robbins' no man's land concept is when you're not really happy about your life, but you're not unhappy enough to do anything about it. You want to avoid this complacency.

~~Book Summary: The Compound Effect by Darren Hardy~~

In “The Compound Effect”, Darren Hardy debunks those myths, and focuses on a simple but profound truth – Success comes from the small things that we do consistently, everyday, compounded over time.

This book provides a comprehensive overview of carotenoid biosynthesis by different organisms, including bacteria, archaea, fungi, arthropods, and plants. Carotenoids are thought to provide health benefits in areas such as cancer, diabetes, osteoporosis, NAFLD, NASH, obesity, age-related functional decline, and as a result, they have received an increasing amount of attention. With contributions from leading experts in biology, biotechnology, and chemistry of carotenoid research, this volume discusses the biological functions of carotenoids such as astaxanthin, β-cryptoxanthin, and fucoxanthin, in addition to paprika carotenoids, capsanthin, and capsorubin. It also reveals the technologies behind the commercial production of some functional carotenoids. The book is targeted for academic and industrial readers in biology, biotechnology, nutrient physiology and related fields.

This work presents and evaluates methods employed to identify the potential of certain types of chemicals to adversely affect the skin. A variety of test methods are included such as tests for skin penetration, metabolism, irritation, the skin immune system, photo effects, skin cancer, and topical effects of retinoids and depigmenting chemicals. Tests for chemicals that affect the reproductive and nervous system are also included. Both animal and human tests that have been standardised and tests that are under development and employ animal alternatives are addressed in this book. Besides different testing methods, a rationale for accepting non-animal models and a review of some regulatory agency discussions about animal alternative tests are included.

In the future' the decade of the 1990s will likely be viewed as a Golden Age for retinoid research. There have been unprecedented research gains in the understanding of retinoid actions and physiology; since the retinoid nuclear receptors were first identified and the importance of retinoic acid in develop mental processes was first broadly recognized in the late 1980s. Between then and now, our knowledge of retinoid action has evolved from one of a near complete lack of understanding of how retinoids act within cells to one of sophisticated understanding of the molecular processes through which retinoids modulate transcription. In this volume, we have tried to provide a comprehensive update of the present understanding of retinoid actions, with an emphasis on re cent advances. The initial chapters of the volume, or Section A, focus on the physicochemical properties and metabolism of naturally occurring retinoids: - N OY provides an uncommonly encountered view of retinoid effects from the perspective of the physiochemical properties of retinoids. - V AKIANI and BUCK lend a perspective on the biological occurrence and actions of retro- and anhydro-retinoids. Section B considers both the retinoid nuclear receptors and their mechanisms of action as well as synthetic retinoids that have been used exper imentally to provide mechanistic insights into receptor actions and have potential therapeutic use for treating disease: - PIEDRAFITA and PFAHL provide a comprehensive review of retinoid nuclear receptor biochemistry and molecular biology.

Transcription Factors Normal and Malignant Development of Blood Cells Katya Ravid and Jonathan Licht The role of transcription factors in activating specific genes in blood cells is an important facet of hematopoiesis. Equally important, however, is the pursuit of genes rearranged and aberrantly activated in leukemias (blood malignancies). Transcription Factors: Normal and Malignant Development of Blood Cells focuses on those major transcription factors involved in activation of lineage-specific gene expression during normal versus malignant development of specific blood lineages, as revealed from gene promoter studies, knockout of transcription factors in mice models, and the identification and characterization of chromosomal rearrangement in human blood leukemias. This complete digest of current transcription factor data offers comprehensive coverage of the myriad of transcription factors in blood cell development, composed by established experts in the field. In addition to updating the reader on the connection between chromosomal translocations involving transcription factors and cellular transformation leading to leukemia, Transcription Factors also reviews such subjects as: * Transcription factors and the megakaryocytic, myeloid, and erythroid lineages * Leukemias due to chromosomal translocations involving gene encoding transcription factors * Oncogenesis and hematopoiesis * In vivo studies of transcription factors implicated in hematopoiesis * And much more Appealing to both the researcher and the clinician in the field of hematology, Transcription Factors is a timely presentation of cell lineage development and sheds light on the processes involved in the development of specific leukemias. Providing insight into the study of transcription factors, readers will gain an understanding of mechanisms that lead to normal lineage commitment and terminal differentiation.

The Advances in Cancer Research series provides invaluable information on the exciting and fast-moving field of cancer research. A very special event the Nobel Minisymposium, “Molecular Oncology – From Bench to Bedside, held at the Karolinska Instituet, in Stockholm, Sweden, was marked the celebration of George and Eva Klein’s combined 160th birthday. To honor this occasion, this 2nd of two volumes brings together contributions by their former students, colleagues and collaborators of the past fifty years into a volume of Advances in Cancer Research dedicated to George and Eva. Over a decade ago, a subdivision of ACR called “Foundations in Cancer Research was initiated and the tributes honoring the Kleins’ bodies of work presented at the minisymposium are especially appropriate for the series.

Scientific Frontiers in Developmental Toxicology and Risk Assessment reviews advances made during the last 10-15 years in fields such as developmental biology, molecular biology, and genetics. It describes a novel approach for how these advances might be used in combination with existing methodologies to further the understanding of mechanisms of developmental toxicity, to improve the assessment of chemicals for their ability to cause developmental toxicity, and to improve risk assessment for developmental defects. For example, based on the recent advances, even the smallest, simplest laboratory animals such as the fruit fly, roundworm, and zebrafish might be able to serve as developmental toxicological models for human biological systems. Use of such organisms might allow for rapid and inexpensive testing of large numbers of chemicals for their potential to cause developmental toxicity; presently, there are little or no developmental toxicity data available for the majority of natural and manufactured chemicals in use. This new approach to developmental toxicology and risk assessment will require simultaneous research on several fronts by experts from multiple scientific disciplines, including developmental toxicologists, developmental biologists, geneticists, epidemiologists, and biostatisticians.

The FactsBook Series has established itself as the best source of easily accessible and accurate facts about protein groups. They use an easy-to-follow format and are researched and compiled by experts in the field. This Factsbook is devoted to nuclear receptors. The first section presents an introduction and describes the mode of action of the receptors in general. The second section of the book contains detailed entries covering each type of receptor. Entries provide information on: Nomenclature and structure, Isolation, DNA binding properties, Ligands, Expression, Target genes, Knockouts, Disease association, Gene structure, promoter and isoforms, Chromosomal location, Amino acid sequences, Key references

Nuclear Receptors in Development and Disease, Volume 125, the latest volume in the Current Topics in Developmental Biology series, covers nuclear receptors in development and disease, and includes contributions from an international board of authors. The book's chapters provide a comprehensive set of reviews that cover such topics as nuclear differentiation and remodeling, evolution of receptors, ligand signaling and neural development. Covers the area of nuclear receptors in development and disease Includes contributions from an International board of authors Provides a comprehensive set of reviews on topics as nuclear differentiation and remodeling, evolution of receptors, ligand signaling and neural developments
